

## Provides the Most Sought-After CLASS 5 Features

PhoenixSoft developed the Cirrus Softswitch for service providers to integrate low-cost, feature-rich IP applications in a variety of network configurations. With the flexibility to work within any Legacy, TDM or VoIP environment, the Cirrus Softswitch IP-enables an existing TDM network and/or works in harmony with an existing network softswitch to add advanced functionality.

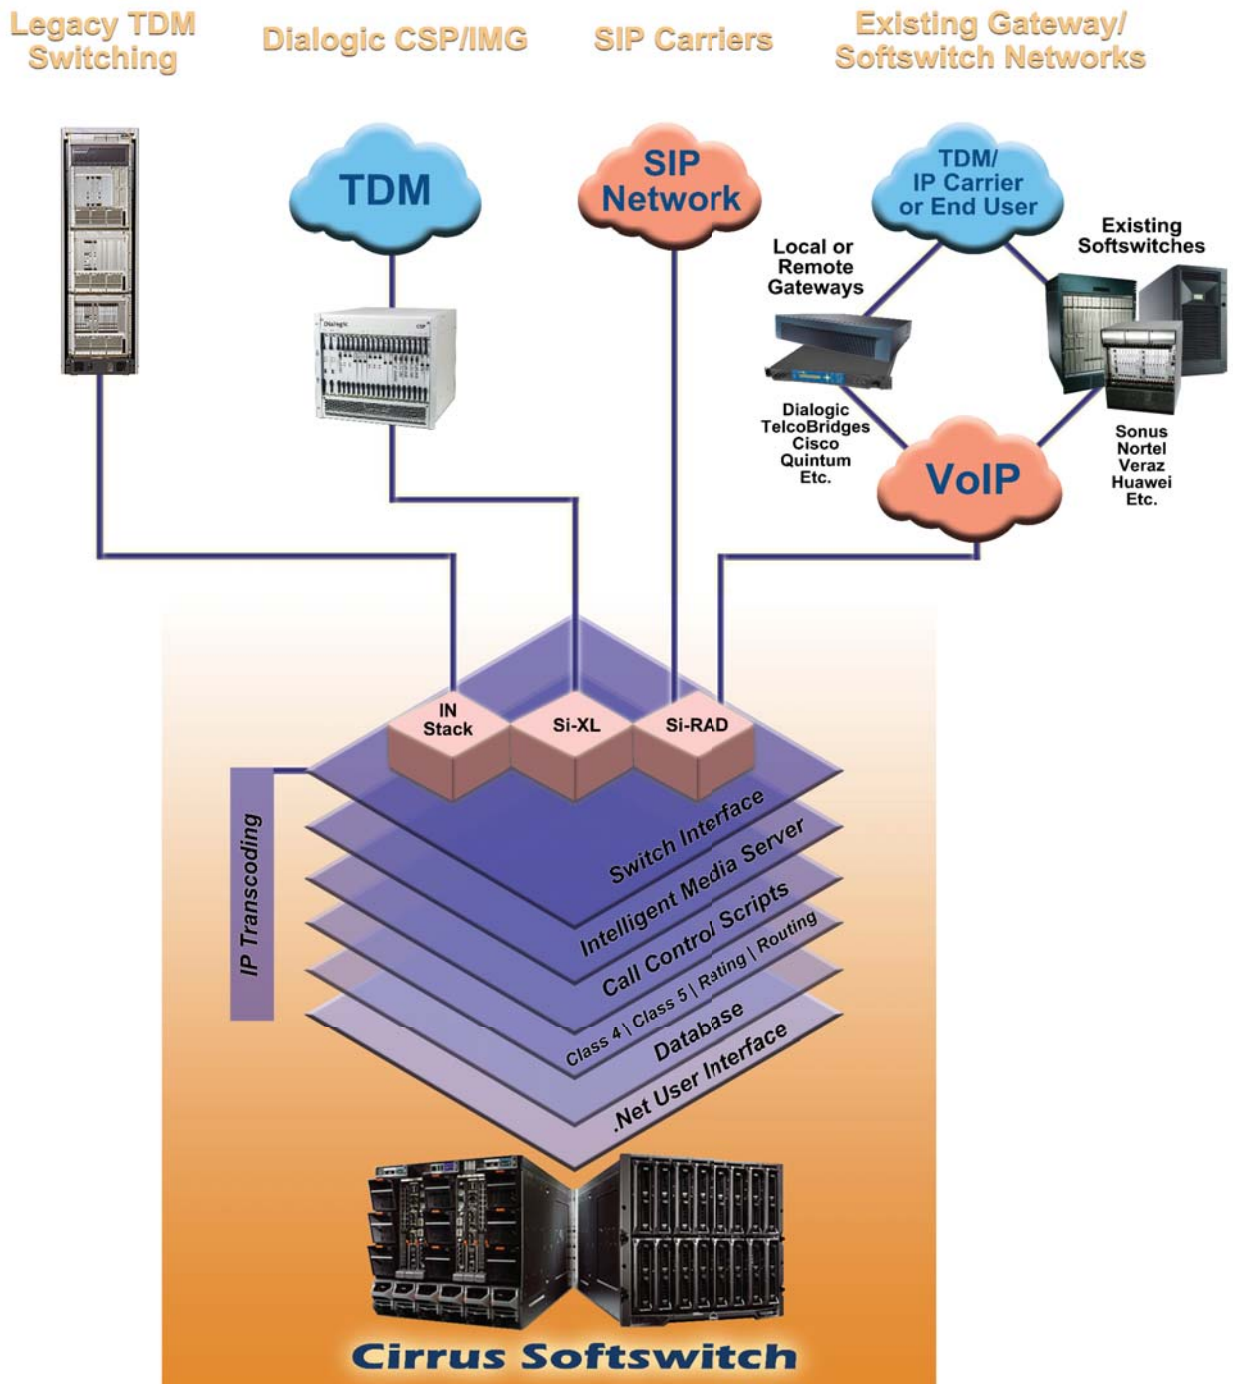

As a next-generation communications platform for converged networks, the Cirrus Softswitch offers a host of Class 5 features.

"Class" codes, which stands for "Custom Local Area Signaling Services" codes, are accessed by a local telephone subscriber. These customer-dialed codes provide access to features and services provided by carriers. Some of the assigned services include call forwarding, voice mail, 3-way calling and many others.

The list below includes definitions of the Class 5 features integrated within our Cirrus Softswitch.

<b>3-Way Calling</b>	allows a current two party call to dial another number and have a 3rd caller on the line and placed into the conversation.
<b>Automated Attendant</b>	uses a 24/7 customizable automated system that transfers calls dialed by extension, name, company directory, or workgroup. If caller doesn't answer or line is busy, the system sends the call to voice mail.
<b>Call Block</b>	allows users to input phone numbers of callers from whom they do not want to accept calls.
<b>Call Forwarding</b>	redirects an incoming call to a called party, which would otherwise be unanswered, to a mobile or alternate number.
<b>Call Hold</b>	places a current call on hold without ending the call.
<b>Call Return</b>	provides a called party the time and telephone number of the last received call and enables a call back to that party.
<b>Call Transfer</b>	allows a user to relocate an existing call to another telephone by pressing a transfer button and dialing the required location.
<b>Call Waiting</b>	signals an incoming call while you're on the phone with another caller. You can alternate between parties using the same phone line so you don't miss any calls.
<b>Caller ID</b>	transmits a caller's number and name to the called party's telephone equipment during ringing.
<b>Follow-Me</b>	routes a received call for a particular person to each number on the list in turn until the call is answered or the list is exhausted.
<b>Hunting</b>	distributes phone calls from a single number to a group of several phone lines.
<b>Personal 800</b>	gives you your own personal toll free number to have calls come into at no cost to the caller.
<b>Repeat Dialing</b>	redials the number of your last outgoing call without entering all the digits.
<b>Ring Groups</b>	defines a "virtual" extension that rings a group of phones simultaneously, stopping when any one of them is picked up.
<b>SoftPhone</b>	allows your computer to become your telephone with a high-speed Internet connection.
<b>Virtual Number</b>	refers to a telephone number without a directly-associated phone line. Virtual numbers are usually forwarded to a different phone line, fixed or mobile.
<b>Voice Mail</b>	allows callers to leave messages when you're not available to answer your phone. You can access your voice mailbox from anywhere, personalize your greeting and manage your voice mail folders.
<b>Voice Mail to E-mail</b>	allows voice mail messages to be sent as a .wav file directly to your e-mail account.

**Cirrus Softswitch provides a comprehensive switching solution that integrates enhanced features within a variety of network configurations, including Legacy Programmable Switches and SIP-compliant Gateways, Gatekeepers, Softswitches or other devices.**
